

9,000 COUNT SHEETS? YES!

INNOVATIVE NEW FABRIC SLEEP SYSTEM BY CUPROTEX

The combination of age-old luxury sateen weave design fabric, protected by the new Cupron copper technology permanently imbedded in silky micro fibers promises you the best sleep surface ever!

Here's how it works!

The sateen construction allows us to make basically a two sided fabric. Over 140 super soft ends of yarn in every inch of the fabric are woven side by side to form the sleeping surface next to your skin. Each of these 140 ends contains a bundle of 68 continuous tiny micro fiber filaments, for a total of 9,520 silk-like ends of yarn in every inch of the fabric surface. **This provides the unmatched softness and support for your skin.**

The micro fiber is designed not to be very absorbent, but due to the extremely high number of filaments, and the addition of the Sorbtek™ moisture wicking treatment during manufacturing, it becomes a super moisture movement system. The moisture normally lost from your skin while you sleep is quickly transported away from your sleep surface, and into the back of the fabric which is made from natural highly absorbent cotton. **This provides the unmatched dry and comfortable sleeping surface.**

The copper ions from the Cupron copper oxide embedded in the micro fiber are released by the body's moisture to allow the copper's positive effects for the appearance of your skin and its other ability to eliminate the microbes in the fabric that cause staining and most odors. **This provides the unmatched safe and clean sleeping environment for the place you spend fully one third of your life!**
